

English Script – *Endodontic Treatment*

This script is the English version of a Sango video found online: https://youtu.be/aafuMssn_g/

Sometimes, the infection in your tooth has gone too deep and a simple filling will not work. If the roots of your tooth are affected, you will need further treatment. This is more complicated than a filling. This procedure requires many long appointments. This treatment is not guaranteed to be successful. Your dentist will use lots of special instruments to clean out the root system of your teeth to remove the germs and then fill the roots with special materials. This can be a very difficult procedure which is why it sometimes does not work.

The project was funded by Qld Department of Health and developed by the Refugee Health Network Qld in partnership with the Townsville Oral Health Centre (June, 2019). Thanks to NSW Refugee Health Service NSW refugee health service and Centre for Oral Health Strategy for sharing some of their content and pictures
